

Reliable

Reliable measurement, independent of both ambient and process conditions

Cost effective

Highly resistant materials ensure a long service life

User friendly

Simple installation and setup

Reaction vessel

Level measurement and point level detection in the reaction vessel

Changing media, as well as process pressures and temperatures, characterize the typical reaction processes in a reaction vessel. This is a big engineering challenge, because any sensors used to control the process need to deliver reliable measurements under these conditions. To meet the diverse conditions found in reaction vessels, level measurement and point level detection instrumentation must cover a broad spectrum of applications.

More details

VEGAPULS 6X

Non-contact level measurement with radar in reaction vessels

- · Measuring result unaffected by agitator thanks to false signal suppression
- High chemical resistance through PTFE antenna cover
- Small process fittings allow easy installation

Show Product

VEGASWING 63

Vibrating level switch for liquids for level detection as overfill and dry run protection system in the reaction vessel

- Media-independent switching point, reliable level information
- Highly resistant materials and coatings allow use in a variety of media
- Test button for easy testing of instrument functionality during operation
