

Reliable

Certified materials according to FDA and EC 1935/2004 regulations

Cost effective

Accurate monitoring optimizes the brewing process

User friendly

One measuring instrument, three measured values: Level, overpressure, temperature

Level, pressure and point level measurement in the fermentation tank

After the wort has been cooled down to the appropriate temperature in the wort cooler, it is pumped into the fermentation tanks. The fermentation process is then started by adding in yeast. The yeast converts the malt sugar dissolved in the wort into carbonic acid and alcohol. To ensure optimal fermentation in the tank, the following key parameters are measured: hydrostatic pressure for determining the level, overpressure for CO2 content monitoring and limit level for overfill or dry run protection.

More details

VEGABAR 82

Level measurement via electronic differential pressure measurement in the fermentation tank

- Reliable measurement unaffected by condensation thanks to encapsulated measuring cell
- Good cleanability thanks to hygienic design and flush mounting
- Additional temperature measurement by temperature sensor located very close to the process

Show Product

VEGABAR 38

Pressure sensor for pressure monitoring in the yeast supply line and in the CO2 discharge line

- Ceramic CERTEC® measuring cell is resistant to CIP cleaning
- Good cleanability thanks to hygienic design
- Bluetooth communication for easy operation

Show Product

VEGAPOINT 21

Capacitive level switch as overfill and dry run protection in the fermentation tank

- 360° status display for quick and easy recognition of switching status
- Compact design facilitates cleaning
- Reliable measurement independent of condensation and foam
