

Reliable

Precise measurement in tank with stirrer

Cost effective

Optimal tank volume utilization

User friendly

Simple mounting and setup

Alumina powder stirring tank

Level measurement in the alumina powder stirring tank

The extraction of Aluminium from natural deposits of bauxite requires complex and expensive processes. In the 'Bayer process, the bauxite is first mixed with sodium hydroxide, autoclaved and then stirred. After that, it is fed into the calciner (high temperature kiln), where it dehydrates to a fine white powder, aluminium oxide (Al2O3). Level measurement in this tank ensures optimal operation of the process.

More details

VEGAPULS 6X

Non-contact level measurement with radar in stirring tanks

- Reliable measurement even with strongly agitated product surface
- High measurement certainty despite heavy condensation formation
- High operational availability, because wear and maintenance-free
