

Reliable

Reliable pressure measurement in the lubrication system, even with strong vibration

Cost effective

Long-term stable vacuum measurement with oil-free ceramic measuring cell

User friendly

Temperature information on air and lubricating oil also available for the control system

Vacuum system

Level and pressure measurement in the vacuum system

A vacuum system is used to perform dewatering on the high-speed paper machines. The required high vacuum is generated by a single or multi-stage centrifugal blower. The strength of the vacuum is regulated by the rotational speed of the electric drives. For this purpose, the vacuum must be continuously measured. It is also necessary to monitor the bearing lubrication system to ensure reliable operation of the vacuum blower itself. To achieve this, the pressure in the lubricating lines and the level in the lube oil supply tank need to be measured.

VEGABAR 38

Pressure measurement for speed control of the pump drive

- Long-term stable vacuum measurement with dry measuring cell
- Air and lubricating oil temperature information also available from the transmitter for the control System
- Reliable operation through high overload resistance

VEGACAL 63

Capacitive level measurement in the oil supply tank

- Economical level measurement through use of low-cost transmitter
- Long service life thanks to robust mechanical design
- Maximum tank utilization, as probe measures over its entire length
