

### Reliable

External detectors provide a high-resolution density profile without being exposed to process conditions

### Cost effective

No shutdown required for maintenance

### User friendly

Standard instruments without PLC or special tools

## Interface profiler

### Multi-phase oil/water interface measurement in separator tanks with emulsion layers

Separation tanks on the deck of an FPSOs contain oil and water as well as other products. Mixing hydrocarbons with water can form an emulsified layer that makes it extremely difficult for operators to detect and control the water level. This can lead to loss of hydrocarbons when the water is drained or even damage to the electrostatic grids in desalination tanks due to the salty feed water. Multi phase density profiling is required to identify the different layers, including sand, for reliable, efficient process control. Level measurement is also required to ensure redundancy.

#### More details

### VEGAFLEX 86

Level and interface measurement in the bypass

- High accuracy of the level in an external bypass chamber
- Shortenable rod probe allows great flexibility in project planning
- Reliable measurement, independent of process density, temperature and pressure

#### Show Product

### VEGAPULS 6X

Level measurement with radar through isolation valve in the interface profiler.

- High-precision measurement independent of pressure, temperature or density
- SIL conformity according to IEC 61511 for functional safety
- High dynamic range independent of dielectric constant, foam or varying hydrocarbons

#### Show Product

### MINITRAC 31

Radiometric multiphase interface measurement in oil separators

- High-resolution density measurement with scintillation detectors that can detect the smallest changes in radiation absorption by different media
- Maintenance-free and accessible, as the sensors are installed outside the vessels
