## Heat recovery boiler

### Level measurement and point level detection in the heat recovery boiler

In the heat recovery boiler, hot process gas is passed through heating pipes. This means the gas is cooled and the necessary process heat for the plant recovered to be reused. To prevent the heat recovery boiler from running dry and thus overheating, reliable monitoring of the water level in the boiler is required. For maximum safety, the measurement is carried out redundantly with diverse instrument technology.

### VEGAFLEX 86

Continuous level measurement with guided radar in the heat recovery boiler

- Vapour compensation enables reliable measurement despite changing pressures and temperatures
- Special ceramic-graphite seal can be used up to 450 °C
- Available with SIL2 and boiler approvals for assured safety

### VEGASWING 66

Vibrating level switch for reliable detection of minimum and maximum water level

- High level of safety via self-monitoring of sensor element and electronics at high process temperatures and pressures
- Redundant measurement for maximum safety
- Available with SIL2 and boiler approvals
- Fast and reliable function test by press of a button
