

Reliable

Approved materials according to FDA and EG 1935/2004

Cost effective

Optimal cleaning thanks to front-flush measuring cell

User friendly

Simple mounting

Concentrator

Density measurement of tomato juice in a concentrator

The so-called Brix value (expressed in Brix degrees) is controlled in a concentrator. This value indicates the proportion of solids in a liquid (density). A certain Brix value is required, for example, to produce an optimal tomato concentrate. The liquid circulates in a spiral tube, from which the concentrate is obtained. The liquid content is extracted via evaporation in a special chamber. Electronic differential pressure measurement ensures accurate density measurement.

More details

VEGABAR 82

Measuring density accurately in a concentrator using electronic differential pressure measurement.

- Exact measurement for determining the solid content
- Reliable measurement, unaffected by condensation
- Dry measuring cell is vacuum resistant and long-term stable
