

Reliable

Reliable level measurement across all pressure and temperature ranges

Cost effective

Standardized operation in all the measuring principles

User friendly

Robust and maintenance-free sensors reduce maintenance overhead

Distillation column

Level and pressure measurement in the distillation of primary products

The process temperatures in a distillation column place high demands on the measurement technologies deployed. The boiling point of the distillate frequently exceeds 400 °C. The aim is to achieve the highest possible product throughput for cost-effective operation of the plant. This means the raw material replenishments need to be optimally controlled by level and process pressure measurement in the column.

More details

VEGABAR 81

Measurement of head pressure with pressure transmitter in the distillation column

- Reliable head pressure measurement, even with vacuum or overpressure
- Measurement result unaffected by temperature variations during the start up
 and shutdown of the column
- Durable pressure transmitter can withstand temperatures of up to 400 °C

Show Product

VEGAFLEX 86

Level measurement of the extraction trays of the distillation column with guided radar

- Maintenance-free measuring principle reduces maintenance costs to a minimum
- Delivered as a complete solution with bypass VEGAPASS 81
- Particularly high system reliability through extensive diagnostic functions and SIL qualification according to IEC 61508 (SIL2)
