

Reliable

Reliable content measurement in the fly ash silo

Cost effective

Maintenance-free operation through noncontact measurement

User friendly

Simple mounting and setup

Fly ash silo, ash bunker

Level measurement and point level detection in the fly ash silo or bunker

The burning of coal creates huge quantities of ash. It is collected in a silo or bunker and then dumped into an open pit. To determine the filling height, radar transmitters and level detectors are deployed in the respective vessels.

More details

VEGAWAVE 63

The vibrating level switch dependably prevents an overfilling of silos and bunkers

- Product-independent switching point, thus ideal for bulk solids
- Robust design ensures minimal costs for maintenance and repair
- Approved according to Ex and SIL2

Show Product

VEGAPULS 6X

In silos and bunkers, radar sensors are mainly used to determine the filling height

- High plant availability thanks to wear and maintenance-free measuring instrument
- Non-contact measurement; unaffected by steam, dust and noise
- Ideal for measurement of bulk solids in high silos and bunkers
