Batching tank for ointments

Level and pressure measurement and point level detection in ointment production in batch mode

Many different ointments and creams are produced in batching tanks. The process conditions in batch production are typically characterized by high temperatures and vacuum. After each batch run, the tank needs to be cleaned quickly and effectively with chemically aggressive cleaning agents ready for the next batch. Contamination of the products during the mixing or reaction process is prevented by the use of a protective gas atmosphere. To ensure a safe, reliable process, both the level and the gas head pressure must be continuously monitored.

More details

VEGABAR 83

Level, pressure and electronic differential pressure measurement with two pressure transmitters in the batching tank

- By measuring the pressure in the upper and lower region of the tank, both the gas head pressure and the level can be reliably monitored
- The thermally self-compensating METEC® measuring cell measures accurately and reliably – despite cleaning-related thermal shock
- Hygienic process fittings are ideal for use in sterile production processes

Show Product

VEGASWING 61

Point level detection with vibrating level switches in batch operation

- Reliable detection of the limit level, regardless of the product or process properties
- Hygienically optimised process fittings ensure easy cleaning and maximum process safety
- Easy to install, even the very smallest process fittings are possible
