

Reliable

Reliable measurement despite steam and changing stock temperatures and densities

Cost effective Optimal utilization of the container volume

User friendly Simple installation and setup

Storage towers

Level measurement in storage towers

Large quantities of prepared stock are needed to keep a paper mill running continuously. This material is stored in high storage towers. They are characterised by their large material throughput and agitators that ensure the homogeneity of the stock. Inside, the warm stock generates lots of steam and the pumping and stirring processes make the surface very turbulent. Reliable level measurement ensures a continuous supply of stock and prevents the agitator from running dry.

More details

VEGABAR 82

Hydrostatic level measurement as dry run protection for the agitator

- Front-flush installation in ball valve fitting
- Installation and removal without emptying storage tower
- Long-term stability thanks to dry measuring cell

Show Product

VEGAPULS 6X

Level measurement with radar in storage towers

- Non-contact, maintenance-free level measurement
- Reliable measurement, unaffected by steam
- Very good beam focusing enables exact measurement, even with heavy deposits on the silo walls
