

Ammonia reactor

Reliable

Special sealing concept prevents diffusion by the ammonia

Cost effective

Maintenance-free operation even at high temperatures and pressures

User friendly

Simple installation and commissioning

More details

VEGABAR 81

Pressure transmitter for measuring pressure at reactor inlet

In the ammonia reactor, nitrogen reacts with hydrogen to form ammonia. The temperature in the reactor

itself does not take place in the interior of the reactor, but in the cooler inlet pipe of the reactor.

can be anywhere up to 500 °C at pressures of 200 bar. To monitor the system pressure, the measurement

Pressure measurement at the inlet of the ammonia reactor

- Reliable measurement at high temperatures and pressures
- Special sealing concept prevents ammonia diffusion when handling
 aggressive media
- Long service life through use of chemically resistant materials
