

Reliable

Special sealing concept prevents diffusion by the ammonia

Cost effective

Maintenance-free operation even at high temperatures and pressures

User friendly

Simple installation and commissioning

Ammonia reactor

Pressure measurement at the inlet of the ammonia reactor

In the ammonia reactor, nitrogen reacts with hydrogen to form ammonia. The temperature in the reactor can be anywhere up to 500 °C at pressures of 200 bar. To monitor the system pressure, the measurement itself does not take place in the interior of the reactor, but in the cooler inlet pipe of the reactor.

VEGABAR 81

Pressure transmitter for measuring pressure at reactor inlet

- Reliable measurement at high temperatures and pressures
- Special sealing concept prevents ammonia diffusion when handling aggressive media
- Long service life through use of chemically resistant materials
